FOREWORD

This report covers work done by The Service Bureau Corporation, 425 Park Avenue, New York, New York, under Contract No. AF 33(657)-11194 with the Aerospace Medical Research Laboratories. The work was performed in support of Project 7233, "Biological Information Handling Systems and Their Functional Analogs," Task 723304, "Neural Networks." Lt. Colonel Jack E. Steele, MC, USAF, of the Biomedical Laboratory, was the technical contract monitor of the Aerospace Medical Research Laboratories.

The principle Service Bureau personnel were Dr. Hanan Rubin and Mr. Frank Gracer, simulation research and development; Mr. Kenneth Orr, simulation conversion to existing systems; and Mr. James Flaugher, simulation analysis and modification. The work was begun 19 March, 1963 and completed 15 April, 1966

This technical report has been reviewed and is approved

J. W. Heim, PhD. Technical Director Biomedical Laboratory Aerospace Medical Research Laboratories

ABSTRACT

Because of the large number of network combinations and parameter variations possible in a Steele neuromime network, a program for simulating the nets on a digital computer is being developed to aid in determining the most efficient nets for specific tasks. The results of the investigation of network and parameter variations may then be used as the restraints and design criteria for neuromime devices with specific signal recognition capabilities. The simulation provides as a tool, a means of generating randomly connected networks with desired statistical restraints and a training phase which alters the network in such a manner as to force the actual response closer to the desired response. The generalized nature of the nets used is the essence of the research effort. Appendix II contains the neuromime simulator output.
